Software Engineer
Software Developer

I am a dedicated and enthusiastic software developer with experience in cross-functional teams and projects. I have a solid understanding of data structures and algorithms, web technology, programming languages, and frameworks. I am confident in my ability to develop high-quality software solutions that meet or exceed client expectations.

I am also a strong organizational and time management skills. I am able to consistently meet deadlines and deliver exceptional work. I am a proactive learner and team player, and I am excited about the opportunity to continue growing as a developer while contributing to the success of a junior or mid-level role within a dynamic organization.

EXPERIENCE

Software Developer

Xphiz· December 2021 – present

- Designing and developing the front-end of the application. This involves creating user interfaces using technologies such as HTML, CSS, and javascript, and ensuring that the user experience is smooth and intuitive.
- Designing and developing the backend of the application. This includes creating and managing the server-side logic using frameworks such as Spring, Liquidbase, and Hibernate and ensuring the application is scalable, secure, and efficient.
- Integrating the front-end and back-end of the application. This involves integrating various components of the application and ensuring they work together seamlessly.
- Collaborating with the team. With shared tasks comes lots of inter and intra developers collaboration. This involves working with other developers, designers, and stakeholders to ensure that the application meets the requirement and is delivered on time.
- Testing and debugging. This involves testing the application for bugs and issues and Debugging any issues that arise.
- Packing and deployment of applications. This involves packaging, deployment, and hosting of applications at production.

Tithcqo

Front-End Developer · September 2019 – November 2022

- Developing web applications using a variety of programming languages and frameworks
- Designing and implementing data-driven solutions
- Working with cross-functional teams to deliver high-quality products
- Managing competing priorities and meeting deadlines
- Learning and adapting to new technologies

EDUCATION

Federal Polytechnic Ado-Ekiti

HND in Physics with Electronics

TECHNOLOGIES/SKILLS

- HTML
- CSS
- Javascript
- Typescript
- Reactjs
- Nextjs
- Flutter
- WordPress
- Github
- Nodejs
- SQL
- Xammp
- MongoDB
- AWS
- Vercel
- Critical thinking
- Leadership
- Content Creation
- Writing

PROJECTS

https://hugedreamproperties.com/

Platform: Web

This real estate website allows users to search for and find real estate listings. I also build it to provide information about the real estate market.

The development of this real estate website includes the following steps:

Requirements Definition. I define the requirements for the website. This includes the features that the website will need, such as the ability to search for listings, view property details, and contact real estate agents.

Design the website. Once the requirements have been defined, I designed the website by creating the layout of the website, page design, and branding for the website.

Develop the website. The next step is to develop the website which includes coding the website, adding the features, and testing the website.

Deploy the website. Once the website has been developed, I deployed the website to a web server. This makes the website accessible to users.

Website Maintenance. Once the website has been deployed, I maintained it by updating the website with new features, fixing bugs, and monitoring the website for performance issues.

Platform: Web, ios, android

This is a fashion e-commerce marketplace website that allows users to buy and sell fashion products from a variety of sellers. It is a convenient way for consumers to find the latest fashion trends and for sellers to reach a wider audience.

The development of a fashion e-commerce marketplace includes the following steps:

Define the requirements. The first step I took was to define the requirements for the marketplace which includes the features that the marketplace will need, such as the ability to search for products, view product details, and checkout.

Design the marketplace. After I finished defining the requirements, I designed the marketplace. The design includes creating the layout of the marketplace, the design of the pages, and the branding for the marketplace.

Develop the marketplace. The next step is to develop the marketplace. This includes coding the marketplace, adding features, and testing the marketplace.

Deploy the marketplace. After I finished developing the marketplace, I deployed it to a web server. This makes the marketplace accessible to users.

Market the marketplace. Once the marketplace has been deployed, it needs to be marketed. This includes promoting the marketplace to potential users through social media, in which I worked on.

https://wooxy.ng/

A furniture e-commerce website.

Platform: web

https://mumconfessions.com/

A digital community for Moms, and Moms to be.

Platform: Web, ios, android

https://xphiz.com/

An online tech school.

Platform: Web

https://legalworksassociates.com/

A legal website

Platform: Web

Key Skills: Next.js | React | HTML | CSS | Flutter | Node.js | NoSQL | WordPress
